                                                                                                                                                                untarction, stroke and reperfusion injury. Assays can also be used to obtain apoptosis enhancing compounds to treat or prevent diseases characterised by the loss of apoptotic cell death, such as cancers, e.g. lymphoma and hormone dependent tumours, autoimmune diseases, e.g. systemic lupus erythematosus and immune-mediated glomerulonephritis and viral infections, e.g. herpesvirus, povvirus or adenovirus infection. Bad can also be used for detection and diamnosis
            The present sequence is the human Bcl-xL/Bcl-2 associated death promoting polypeptide, Bad, the binding of which to Bcl-Xl results in the induction of programmed cell death, i.e. apoptosis. Bad can be used in screening assays for compounds to treat or

The present sequence is the human APOP-1 protein. This protein, which shares structural and chemical homology with Bcl-2, is involved in cell proliferation. Its coding sequence was isolated by screening a synovial tissue cDNA library using a computer search for amino acid sequence alignments. The gene and protein can be used in the treatment of various cancers, disorders with associated inflammation such as Addison's disease, adult respiratory distress syndrome, allergies, anaemia, asthma, athersociencesis, Crohn's disease, ulcerative colitis, diabetes mellitus, emphysema, glomerulonephritis, gout, Graves' disease, irritable bowel syndrome, lupus erythematosus, multiple sclerosis, myosthenia gravis, myocardial or pericardial inflammation, osteoporosis, rheumatoid cartinis, syndrome and autoimmune thyroiditis, complications of cancer, haemodialysis and extracorporeal circulation, infections, crauma, disorders with associated apoptosis including AIDS and other infectious and genetic immunodeficiencies, meurodegenerative diseases such as Alzheimer's diseases and parkinson's disease, ischeemic injuries such as Marcheimer's diseases and parkinson's diseases including cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autolmmune disease.

The present invention describes an isolated or synthetic polypeptide

(I) comprising a less than full length amino acid sequence of a mutant

(I) comprising a less than full length amino acid sequence of a mutant

Bel-XL/Bcl-2 associated cell death regulator polypeptide (BAD) or its

fragment, which contains amino acid substitutions at Seril8 of a human

BAD, Seri55 of a murine BAD (longer murine BAD) or Seril3 of a murine

BAD, Seri55 of a mutine BAD (longer murine BAD) or Seril3 of a murine

BAD, seri55 of a mutine BAD. (1) has immonstablant, antiviral,

notropic, antilschaemic, vulnerary, cytostatic, antiviral,

antiarthritic, antilnflammatory and immunosuppressive activities, and

can be used as an apoptosis inducer or inhibitior. BAD polypeptides and

polynucleotides can be used for screening candidate compounds and drugs

for activity that promote cell survival or apoptosis. Other uses include

indentified and (mutant) BAD polypeptides are useful in treating

immunodeficiency diseases, neurodegenerative diseases, ischaemic cell

death, reperfusion cell death, wound healing, cancer, viral infections,

lymphoproliferative conditions, arthritis, infertility, inflammation and

autoimmune diseases. The present sequence represents a specifically

claimed human BAD mutant amino acid sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMXDE 120

The invention relates to methods of altering the polypeptide levels in a cell, using proteins selected from S-phase kinase associated proteins 1 and 2 (SKPI, SKP2), SKP2-like proteins (ET) and CUL-1 (a member of the cullin, CDC53 family of proteins). The method is useful for altering the level of p27, cyclin E, Max, Mad, c-Myc, MDM2, p53, Bax, Bad or Bcl-2 polypeptide in a cell. SKP2 and SKP2-like protein levels are useful for detecting tumours, and in monitoring tumor treatment in a mammal. Agents that modulate interactions between SKP and target proteins are useful for
                                                                                                                                                                                     Modulating polypeptide levels in a cell, diagnosing and treating tumor, involves altering levels of proteins such as S-phase kinase associated proteins 1, 2 and cullin/CDC53 proteins -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMXDE 120

                            The present sequence represents a protein of 166 amino acids. The sequence is disclosed as being a protein called BBC6 which regulates cell death through interaction with BG1-2. The DNA may be used for the production of the recombinant protein, which can be used in unspecified therapeutic or diagnostic procedures, as a molecular weight marker, and to raise antibodies that can be used in unspecified diagnostic or therapeutic applications and to reduce or eliminate the biological activity of the BBC6 protein in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; vulnerary; immunosuppressive; apoptosis inducer; apoptosis inhibitor; cancer; immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infection; lymphoproliferative condition; inflammation; autoimmune disease.

The present invention describes an isolated or synthetic polypeptide

(1) Comprising a less than full length amino acid sequence of a mutant
Bel-XL/Bel-2 associated cell death requiator polypeptide (BAD) or its
fragment, which contains amino acid substitutions at Serl18 of a human
BAD, Serl55 of a murine BAD (longer murine BAD) or Serl13 of a murine
BAD (shorter murine BAD) (1) has immunostimulant, neuroprotective,
nootropic, antiischaemic, vulnerary, cytostatic, antiviral,
antiarthritic, antiinflammatory and immunosuppressive activities, and
can be used as an apoptosis inducer or inhibitor. BAD polypeptides and
polynucleotides can be used for screening candidate compounds and drugs
for activity that promote cell survival or apoptosis. Other uses include
inducing or inhibiting apoptosis in a cell. Candidate compounds
identified and (mutant) BAD polypeptides are useful in treating
immunodeficiency diseases, neurodegenerative diseases, ischaemic cell
death, reperfusion cell death, wound healing, cancer, viral infections,
lymphoproliferative conditions, arthritis, infertility, inflammation and
autoimmune diseases. The present sequence represents a specifically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3

This sequence represents the murine bcl-x(L)/bcl-2 associated death promoter (Bad) gene. Bad is a 22.1 kD protein which interacts with brownoter (Bad) gene. Bad is a 22.1 kD protein which interacts with col-2 and bcl-x proteins and regulates cell death. It has homology to the bcl-2-related family clustered in the BH1 and BH2 domain. Bad has been found to hybridise to bcl-x(L) and bcl-2 in yeast two-hybrid assays and in vivo in mammalian cells. Overexpressed Bad counters the death inhibitory activity of bcl-x(L), but is much less effective at countering the death inhibitory activity of bcl-2. Bad expression can accelerate apoptotic cell death induced by cytokine deprivation in an IL-3 dependent cell ine expressing bcl-x(L), and its also counters the death repressor activity of bcl-x(L). Bad competes with Bax for binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be binding to bcl-2 or bcl-x(L) to form heterodimers. Such agents may be conserved by the contact of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The present sequence is the murine BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fragments of mutant BAD protein able to decrease cell viability; (2) increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility.

Cor prevent diseases associated with reduced apoptosis, e.g. cancer, inflammation and autoimmune disease. Polynuclectide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as ABDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family corrections in the cytosol, thus promoting cell survival. The mutants with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMXDE 120

                                                                                                                                                                                                                                                                                                                                to the 14-3.3 protein which is a signal transduction regulator.
Modulators of phosphorylated BAD, which act through inhibition/activation
of a phosphoserine phosphatase, are useful for preventing/treating
increased/decreased apoptosis in a cell. The increased apoptosis may
result from immunodeficiency diseases, senescence, neurodegenerative
disease, ischaemic cell death, reperfusion cell death, infertility and
wound-healing. Decreased apoptosis may result from cancer, viral
infection, lymphoproliferative conditions, arthritis, infertility,
phosphorylated compared to unphosphorylated BAD polypeptide and/or total
BAD in a cell is useful for determining the apoptotic state of a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         vulnerary;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunostimulant; neuroprotective; nootropic; antiischaemic; vulnerary; cytostatic; antiviral; antiarthritic; antiinflammatory; wound healing;
                                                                                                                                                                                                                                                                                               This sequence represents a novel serine-phosphorylated protein, BAD (Bcl-XI/Bcl-2 associated cell death regulator). The serine residue is phosporylated in a post-translational modification and allows binding

```
(1) comprising a less than full length amino acid sequence of a mutant fragment, which contains amino acid sequence of a mutant Bal, Seri55 of a mutane Bab (longer mutine Bab) or Seri18 of a mutane Bab, Seri55 of a mutane Bab (longer mutine Bab) or Seri18 of a mutane Bab, Seri55 of a mutane Bab. (I) has immunostimulant, neuroprotective, notropic, antischaemic, vulnerary, cytostatic, antiviral, antistratic, antilifiammatory and immunosuppressive activities, and can be used as an apoptosis inducer or inhibitor. Bab polyapetides and polynucleotides can be used for screening candidate compounds and drugs for activity that promote cell survival or apoptosis. Other uses include inducing or inhibiting apoptosis in a cell. Candidate compounds inducting or inhibiting apoptosis in a cell. Candidate compounds inducting or inhibiting apoptosis in a cell. Candidate compounds inducting or inhibiting apoptosis in a cell. Candidate compounds immunodeficiency diseases, neurodegenerative diseases, ischaemic cell death, wound healing, cancer, viral infections, lymphoproliferative conditions, arthritis, infertility, inflammation and autoimmune diseases. The present sequence represents a specifically calamed longer murine Bab mutant amino acid sequence from the present
Immunodeficiency disease; neurodegenerative disease; viral infection; ischaemic cell death; reperfusion cell death; arthritis; infertility; lymphoproliferative condition; inflammation; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 61 HGGAGAVEIRSRHSSYPAGTEDDEGMGEEPSPFRGRSRSAPPNLWAAQRYGRELRRMXDE 120

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 aa sequence. The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat corprevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, infinamation and autoimmune disease. Polynuclectide sequences encoding inflammation and autoimmune disease. Polynuclectide sequences encoding cransgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as Albs, neurodegeneration, editor and an association and monthibitors are an individual and monthibitors.
                                                                                 Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection
                                         Mutant BCL-XL/BCL-2 associated cell death regulator #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 7; Page 60; 95pp; English.

3;

The present invention describes mutant BAD (BCL-XL/BCL-2 associated cell death regulator) proteins, having an amino acid other than Ser at cosition 112 and/or 136, relative to the murine BAD 204 as sequence. The presents sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery Wutant BAD proteins are used to treat concreases intracellular delivery Wutant BAD proteins are used to treat concrease infection, lymphoproliferation, arthritis, infertility.

Con prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility.

Con prevent diseases. Polynuclectide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is cetermined by measuring relative amounts of phosphorylated and non-phosphorylated baD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not ceterminelies with BCL-2 or RCL-XL but instead binds to 14-3-3 family contents in the cytosol, thus promoting cell survival. The mutants with Murine; mouse; BCL-XL/BCL-2 associated cell death regulator; BAD protein; serine substituted mutant; apoptosis; cancer; viral infection. New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection Mutant BCL-XL/BCL-2 associated cell death regulator #1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD. by usual immunoassays. Mittent BAD proteins have phosphorylated BAD, by usual immunoassays. Mittent BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14·3·3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14·3·3.
                                                                                 97

The present sequence represents a mutant BAD protein. Also described are: (1) fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is

determined by measuring relative amounts of phosphorylated and non-

```
phosphorylated man, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus promoting cell survival. The mutants with Ser substituted cannot bind 14-3-3.
                                                                                                                                                                                                      Sequence

New mutant BAD polypeptide with phosphorylatable serine replaced useful for, e.g. treating reduced apoptosis such as in cancer or viral infection

Claim 8; Page 73; 95pp; English.

death regulator) proteins, having an amino acid other than Ser at position 112 and/or 136, relative to the murine BAD 204 as sequence. The position 112 and/or 136, relative to the murine BAD 204 as sequence. The fragments of mutant BAD protein able to decrease cell viability; (2) fusion proteins of mutant BAD with a heterologous polypeptide that increases intracellular delivery. Mutant BAD proteins are used to treat or prevent diseases associated with reduced apoptosis, e.g. cancer, viral infection, lymphoproliferation, arthritis, infertility, inflammation and autoimmune disease. Polynucleotide sequences encoding mutant BAD proteins can be used similarly by gene therapy or to produce transgenic animals for use as disease models or in drug screening. BAD proteins phosphorylated at specified Ser are used to screen for enhancers and inhibitors of serine-phosphatase. Inhibitors are potentially useful in treatment of excessive apoptosis such as AIDS, neurodegeneration, aging or ischaemic cell death. The apoptotic status of cells is present invention describes mutant BAD (BCL-XL/BCL-2 associated cell The 1 

determined by measuring relative amounts of phosphorylated and non-phosphorylated BAD, by usual immunoassays. Mutant BAD proteins have greater death-promoting activity than wild-type BAD which can become phosphorylated on the specified Ser, forming a product that does not heterodimerise with BCL-2 or BCL-XL but instead binds to 14-3-3 family proteins in the cytosol, thus romoting cell survival. The mutants with Ser substituted cannot bind 14-3-3. 88888888

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 2, p

Patent No. 5834209
GERERAL INFORMATION:
APPLICAT: KORSMEYER, Stanley J.
TITLE OF INVENTION: Bcl.x/Bcl.2 ASSOCIATED CELL DEATH
TITLE OF INVENTION: REGULATOR
NUMBER OF SEQUENCES: 59
CORRESPONDENCE ADDRESS:
ADDRESSEE: Townsend and Townsend Khourie and Crew
STREET: 379 Lytton Avenue
                                OPERATION SYSTEM: TO LOUS, MS-LOUS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/333,565
FILING DATE: 31-0CT-1994
CLASSIFICATION: 435
ATTONENTYAGENT INFORMATION:
NAME: SMITH, William M
REGISTRATION NUMBER: 30,223
REFERENCE/DOCKET UNMBER: 15726A-000700
TELEPHONE: (415) 326-2402
TELEPHONE: (415) 326-2402
TELEPHONE: (415) 326-242
INFORMATION FOR SED ID NO: 2:

Cell Mol. Genet. 21:279-284(1995).

-!- FUNCTION: VOLTAGE-SENSITIVE CALCIUM CHANNELS (VSCC) MEDIATE THE ENTRY OF CALCIUM IONS INTO EXCITABLE CELLS AND ARE ALSO INVOLVED ENTRY OF CALCIUM-DEPENDENT PROCESSES, INCLUDING MUSCLE CONTRACTION, HORMONE OR NEUROPRANSMITTER RELEASE, GENE EXPRESSION, CELL MOTILITY, CELL DIVISION AND CELL DEATH. THE ISOFORM ALPHA-1A GIVES RISE TO P AND/OR O-TYPE CALCIUM CURRENTS. PA'O-TYPE CALCIUM CHANNELS BELONG TO THE "HIGH-VOLTAGE ACTIVATED" (HVA) GROUP AND ARE BLOCKED BY THE FUNNEL TOXIN (FTX) AND BY THE OMEGA-AGATOXIN-IVA (OMEGA-AGA-IVA), THEY ARE HOWEVER INSENSITIVE TO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Margolis R.L., Breschel T.S., Li S.H., Kidwai A.S., Antonarakis S.E., McInnis M.G., Ross C.A.; "Characterization of cDNA clones containing CCA trinucleotide repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Zhuchenko O., Bailey J., Bonnen P.E., Ashizawa T., Stockton D.W., Amos C., Dobyns W.B., Subramony S.H., Zoghbi H.Y., Lee C.C.; "Autosomal dominant cerebellar ataxia (SCA6) associated with small polyglutamine expansions in the alpha IA-voltage-dependent calcium channel."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 C-ELL BULZDI-ZUYL(1292).

-1- FUNCTION: PROMOTES CELL DEATH. SUCCESSFULLY COMPETES FOR THE BINDING TO BCL-X(L) AND BCL-2, THEREBY AFFECTING THE LEVEL HETERODIMERIZATION OF BOTH THESE PROTEINS WITH BAX. CAN REVERSE THE DEATH REPRESSOR ACTIVITY OF BCL-X(L), BUT NOT THAT OF BCL-2.

-1- SUBUNIT: FORMS HETERODIMERS WITH BCL-X(L), AND BCL-2, BUT NOT WITH
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Yang E., Zha J., Jockel J., Boise L.H., Thompson C.B., Korsmeyer S.J. "Bad, a heterodimeric partner for Bcl-XL and Bcl-2, displaces Bax and promotes cell death.";

-1. SUBCELLUARA LOCATION: INTEGRAL MEMBRANE PROTEIN.

-1. ALTERNATIVE PRODUCTS: AT LEAST 7 ISOFONAS; BI-1/(V2), BI-1/(V2),
BI-1-GGCAG/IA-1 (SHOWN HERE), BI-1/(V1)-GGCAG, BI-1/(V2), BI-1/(V2)

-1. TISSUE SPECIFICITY: BRAIN-SPECIFIC; MAINLY FOUND IN CEREBRAL CORFEX, THALAMUS AND HYDOTHALAMUS. NO EXPRESSION IN
PREDMINNITY PRIVED WINCLE. PURKINJE CELLS CONTAIN
PREDMINNITY PLYPE VOCC, THE O'TYPE BEING A PROMINENT CALCIUM
CURRENT IN CEREBELLAR GRANULE CELLS.

-1. DOMAIN: EACH OF THE FOUR INTERNAL REPEATS CONTAINS FIVE
PURDROPHOLIC TRANSMEMBRANE SEGMENTS (SI, \$2, \$3, \$5, \$6) AND ONE
PROBABLY REPRESENT THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGES AFRANCERIZED BY A
SERIES OF POSITIVELY CHARGES AFRANCE AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGES AFRANCE AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGED AFRANCE AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGED AFRONCE. AT EVERY THIRD POSITION. POLYMORPHISM: THE POLY-GLN REGION OF CACNALA IS POLYMORPHIC: 6 TO TREPEATS IN THE NORMAL POPULATION, EXPANDED TO ABOUT 21 TO 30 REPRATS IN SPINOCERREBELLAR ATAXIA 6 (SCA6) PATIENTS. THERE SEEMS TO BE A CORRELATION BETWEEN THE REPRAT NUMBER AND EARLIER ONSET OF COMPLEXES, CONSISTING OF ALPHA-1, ALPHA-2, BETA AND DELTA SUBUNITS THE DISORDER + <u>:</u> 

DISEASE: EXPANSION OF A CAG REPEAT IN THE CODING REGION OF CACNAIA IS THE CAUSE OF ONE FORM OF SPINOCEREBELLAR ATAXIA 6 (SCA6), AN AUTOSOWAL DOMINNAT DISORDER CHRRACTERIZED BY SLOWLY PROGRESSIVE CEREBELLAR ATAXIA OF THE LIMBS AND GAIT, DYSAPTHRIA, NYSTAGWUS, AND MILD VIBRATORY AND PROPRICCEPTIVE SENSORY LOSS. THESE SYMPTOMS ARE PROBABLY EXPLAINED BY SEVERE LOSS OF CEREBELLAR PURKINJE

DISEASE: DEPECTS IN CACNAIA ARE THE CAUSE OF FAMILIAL HEMIPLEGIC MIGRAINE (FHM), ALSO KNOWN AS MIGRAINE FAMILIAL HEMIPLEGIC I (MHPI), EPISODIC ATAXIA TYPE 2 (EA-2), ACETAZOLAMIDE-RESPONSIVE HEREDITARY PAROXYSMAL CEREBELLAR ATAXIA (APCA), AND POSSIBLY OTHER COMMUN TYPES OF MIGRAINES. FHM, A RARE AUTOSOWAL DOMINARY SUBTYPE OF MIGRAINE WITH AURA, IS ASSOCIATED WITH ICTAL HEMIPARESIS AND, IN SOME FAMILIES, PROGRESSIVE CEREBELLAR ATROPHY. EA-2 IS ANDTHER AUTOSOMAL DOMINANT PAROXYSMAL CEREBELLAR ATROPHY. EA-2 IS ANOTHER BUTOSOMAL DOMINANT PAROXYSMAL CEREBRAL DISEASE, CHARACTERIZED BY ACETOZOLAMIDE-RESPONSIVE ATTACKS OF CEREBELLAR ATAXIA AND MIGRAINE-LIKE SYMPTOMS, INTERICTAL NYSTAGMUS, AND CEREBELLAR ---

SIMILARITY: BELONGS TO THE CALCIUM CHANNEL ALPHA-1 SUBUNITS ATROPHY FAMILY. This SWISS-PROT entry is copyright. It is produced through a collaboration modified and this statement is not removed. Submitted (FEB-1997) to the EMBL/GenBank/DDBJ databases.

-! FUNCTION: VOLTAGE-SENSITIVE CALCIUM CHANNELS (VSCC) MEDIATE THE ENTRY OF CALCIUM IONS INTO EXCITABLE CELLS AND ARE ALSO INVOLVED IN A VARIETY OF CALCIUM DEPRENDENT PROCESSES, INCLUDING MUSCLE CONTRACTION, HORNONE OR BUBNOTRANSMITTER RELEASE, GENE EXPRESSION, CELL MOTILITY, CELL DIVISION AND CELL DEATH. THE ISOFORM ALPHA-1B GIVES RISE TO N-TYPE CALCIUM CURRENTS. N-TYPE CALCIUM CHANNELS BELONG TO THE "HIGH-VOLTAGE ACTIVATED" (HVA) GROUP AND ARE BLOCKED BY OMEGA-AGA-ILIA). THEY ARE HOWEVER INSENSITIVE TO DIHYDROPYRIDINES (DHP), AND OMEGA-AGA-IVA).

CALCIUM CHANNELS CONTAILING ALPHA-1B SUBUNIT MAY PLAY A ROLE IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DIRECTED MIGRATION OF IMMATURE NEURONS.
SUBUNIT: VOLTAGE-DEPENDENT CALCIUM CHANNELS ARE MULTISUBUNIT
COMPLEXES, CONSISTING OF ALPHA-1, ALPHA-2, BETA AND DELTA SUBUNITS
COMPLEXES, CONSISTING OF ALPHA-1, ALPHA-1, BETA AND DELTA SUBUNITS
IN A 1:1:1:1 RATIO: THE CHANNEL ACTIVITY IS DIRECTED BY THE PORE-
FORMING AND VOLTAGE-SENSITIVE ALPHA-1 SUBUNIT: IN MANY CASES, THIS
SUBUNIT IS SUFFICIENT TO GENERATE VOLTAGE-SENSITIVE CALCIUM
CHANNEL ACTIVITY: THE ANXILLARY SUBUNITS BETA AND ALPHA-2/DELTA
LINNED BY A DISULFIDE BRIDGE REGULATE THE CHANNEL ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              01-0CT-1996 (Rel. 34, Created)

SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.
ALTERNATIVE PRODUCTS: 2 ISOFORMS; ALPHA-1B-1 (SHOWN HERE) AND
ALPHA-1B-2; ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: ALPHA-1B-1 AND ALPHA-1B-2 ARE EXPRESSED IN THE
CENTRAL NERVOUS SYSTEM, BUT NOT IN SKELETAL MUSCLE OR AORTH.
DOMAIN: EACH OF THE FOUR INTERRAL REPEATS CONTAINS FIVE
HYDROPHOBIC TRANSMEMBRANE SEGMENTS (51, 52, 53, 55, 56) AND ONE
POSITIVELY CHARGED TRANSMEMBRANE SEGMENT (54). S4 SEGMENTS
PROBABLY REPRESENT THE VOLTAGE-SENSOR AND ARE CHARACTERIZED BY A
SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION.
- PTM: PHOSPHORYLATED IN VITRO BY CAM-KINASE II, CAPK, PKC AND CGPK
                                                                                                                                                                                                                                                  (BY SIMILARITY).
SIMILARITY: BELONGS TO THE CALCIUM CHANNEL ALPHA-1 SUBUNITS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      EXTRACELLULAR (POTENTIAL).

-! TISSUE SPECIFICITY: FOUND IN ALL THE EXAMINED TISSUES INCLUDING HEART BRAIN, LIVER AND KIDNEY. FOUND AT LOW LEVEL IN LUNG.
-!- DISEASE: GENE DELETED IN VELO-CARDIO-FACIAL SYNDROME (VCFS) AND IS HEMIXYGOUS IN ALL VCFS PATIENTS WITH INTERSITIAL DELETIONS. THIS HEMIXYGOSITY MAY PLAY A ROLE IN THE ETIOLOGY OF SOME OF THE PHENOTYPES ASSOCIATED WITH VCFS CHARACTERIZED BY A WIDE SPECTRUM PHENOTYPES, INCLUDING CONOTRUNCAL HEART DEFECTS, CLEFT PALATE AND FACIAL DYSMORPHOLOGY.

VOLTAGE-GATED POTASSIUM CHANNEL HERG (POTASSIUM CHANNEL, VOLTAGE-GATED
SUBFAMILY H MEMBER 2) (ETHER-A-GO-GO-RELATED PROTEIN).
                                                                                                                                                                                                                                                                                                                                                                               phosphoprotein gene.";
J. Dent. Res. 76:754-760(1997).

-I. FUNCTION: COULD BE INVOLVED IN THE INDUCTION OF MINERALIZATION OF EXTRACELLULAR MATRIX AND IN DENTINGENESIS.

-I. TISSUE SPECIFICITY: EXPRESSED IN FETAL BRAIN, BONE AND TOOTH PARTICULARLY IN ODONTOBLAST, BUT NOT IN AMELOBLAST. NOT EXPRESSED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           347 PSQENSSESQEEALHES-RGDNPDNATSHSRE-----HQADSESSEEDVLDKPSDS 396
